What challenges or bugs did you encounter in the process of implementation, and how did you overcome the challenges?

One of the biggest challenges I encountered in the process of implementing my design is figuring out how to make everything go to the right spot, using only vanilla HTML/CSS. In order to overcome these bugs, I watched a lot of tutorials online for programming and styling websites. At the same time, I went to office hours whenever I could to clarify questions. One tip I found to be helpful is dividing up components using multiple divs. For example, if the page has row-column layouts, I would add a div for each row-column so it's easier to format them in a consistent and effective way.

Another challenge I had is how to most effectively format my code so that it's reusable. For example, the home page navigation bar has a similar structure to the navigation bar on other pages. However, the home page navigation bar has white-colored text and the logo is a lot bigger compared to the navigation bar on the other pages. However, the structure should remain the same, so I only want to tweak my CSS, instead of rewriting the entire thing. Therefore, I gave the body tag of the home page an unique id "home" so I added additional CSS styling for the home page. This way, I could still reuse my code while making small changes.

How is the brand identity of your client reflected through your design choices? What kind of look and feel did you design for them and why?

The target customers of this brand are people in their 20-50 who are moving into a new apartment/house or interested in buying new aesthetic decorations for their place. Therefore, the design of this website is meant to be minimalistic and simple, yet aesthetic. I think this is really conveyed right when the users enter the home page. The full-screen background picture sets the tone for this website and makes it more aesthetically pleasing. As the client navigates through the website, they will notice that the design is very consistent and very simple. I decided on this simple design because I believe most young people would like and appreciate this minimalistic and welcoming aesthetic, resonating with their interests in decorating their house. Also making the website simple also allows older people to access with ease as they might find it tedious or difficult having to go through an overwhelming amount of information to find what they are looking for.
